

Portable vTuner API

Reference Implementation

RigiSystems AG in corporation with vTuner.com

Thousands of stations and podcasts, from more than 160 countries all over the globe, carefully categorized and rated. That's what vTuner.com provides. RigiSystems AG has built a portable application programming interface (API) that provides easy navigation and search functionality to find the particular station you're looking for in that huge database.

The vTuner library is written in pure ANSI C, which is a guarantee for simple portability to any system you'd like to use it.

**vTuner.com and RigiSystems AG spice up your
internet radio!**

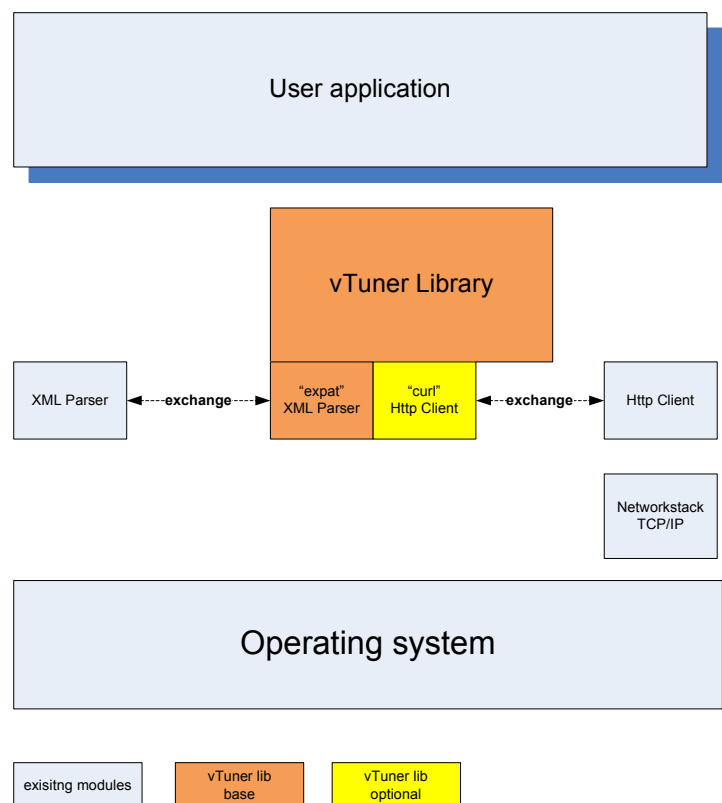

Technical information

The vTuner library can be integrated smoothly into the existing SW-Stack. It comes with the „expat“ - XML parser, and optionally with a light-weight http-client. Both modules can easily be exchanged by already existing modules to save memory consumption.

The library is tested and approved for windows systems, as well as for linux. Due to its strict obligation to ANSI C, the library can be ported to any system.

RigiSystems AG is happy to give you appropriate support, or also may take over the whole integration part.
